

Data leak worksheet

Incident summary: A sales manager shared access to a folder of internal-only documents with their team during a meeting. The folder contained files associated with a new product that has not been publicly announced. It also included customer analytics and promotional materials. After the meeting, the manager did not revoke access to the internal folder, but warned the team to wait for approval before sharing the promotional materials with others.

During a video call with a business partner, a member of the sales team forgot the warning from their manager. The sales representative intended to share a link to the promotional materials so that the business partner could circulate the materials to their customers. However, the sales representative accidentally shared a link to the internal folder instead. Later, the business partner posted the link on their company's social media page assuming that it was the promotional materials.

Control	Least privilege
Issue(s)	Firstly, the manager is at fault here for not unsharing the folder given to the representative. Which, also if the folder contained confidential information, should never have been fully shared in that way anyway. The representative should've also double checked the link they were sending to the business partner before sending.
Review	<i>NIST SP 800-53: AC-6</i> is a reference data leaks subcategory as part of the NIST CSF framework. It describes standards and procedures on how to implement the principle of least privilege. <i>NIST SP 800-53: AC-6</i> describes how allowing only the necessary levels of privilege needed to complete tasks to users is paramount for better security.

Recommendation(s)	<ol style="list-style-type: none"> 1.) Automatically revoking the access to the file after a period of time. 2.) Restrict access to documents based on user role.
Justification	<ol style="list-style-type: none"> 1.) If this was implemented properly, the manager would not have had to even remember to unshared the folder later. As this would take care of disallowing access to the representative after an ordained amount of time automatically. 2.) If this was implemented correctly neither the representative NOR the business partner would've been allowed to access files or materials without proper authorization and could've prevented either from visiting places that the manager or organization might not want them to see.

Security plan snapshot

The NIST Cybersecurity Framework (CSF) uses a hierarchical, tree-like structure to organize information. From left to right, it describes a broad security function, then becomes more specific as it branches out to a category, subcategory, and individual security controls.

Function	Category	Subcategory	Reference(s)
Protect	PR.DS: <i>Data security</i>	PR.DS-5: <i>Protections against data leaks.</i>	NIST SP 800-53: AC-6

In this example, the implemented controls that are used by the manufacturer to protect against data leaks are defined in NIST SP 800-53—a set of guidelines for securing the privacy of information systems.

Note: References are commonly hyperlinked to the guidelines or regulations they relate to. This makes it easy to learn more about how a particular control should be implemented. It's common to find multiple links to different sources in the references columns.

NIST SP 800-53: AC-6

NIST developed SP 800-53 to provide businesses with a customizable information privacy plan. It's a comprehensive resource that describes a wide range of control categories. Each control provides a few key pieces of information:

- **Control:** A definition of the security control.
- **Discussion:** A description of how the control should be implemented.
- **Control enhancements:** A list of suggestions to improve the effectiveness of the control.

AC-6	Least Privilege
	Control: Only the minimal access and authorization required to complete a task or function should be provided to users.
	Discussion: Processes, user accounts, and roles should be enforced as necessary to achieve least privilege. The intention is to prevent a user from operating at privilege levels higher than what is necessary to accomplish business objectives.
	Control enhancements: <ul style="list-style-type: none">● Restrict access to sensitive resources based on user role.● Automatically revoke access to information after a period of time.● Keep activity logs of provisioned user accounts.● Regularly audit user privileges.

Note: In the category of access controls, SP 800-53 lists least privilege sixth, i.e. AC-6.
